

Object example in environment

```

• .setSource(this, R.raw.andy)
• .build()
• .thenAccept { droidRenderable = it }
• .exceptionally { it.toast(this) }}
• -----

```

Then fill in the code to update the position of the droid or any other object and create reference tags to be stored in vector arrays. The same can be done with Unity for changing the position of the items.

Plane Detection Scoring

```

• class TranslatableNode : Node() {
•     fun addOffset(x: Float = 0F, y: Float = 0F, z: Float
= 0F) {
•         val posX = localPosition.x + x
•         val posY = localPosition.y + y
•         val posZ = localPosition.z + z
•         localPosition = Vector3(posX, posY, posZ)

```
