

```

    }    })
    animation.start()
  }}
}

```

The following function will act as a scoreboard to check the interaction of the user with the droid and see at what points the object is hitting and missing.

```

scoreboard.onStartTapped = {
    ...
    // Start the game!
    gameHandler.post {
        repeat(MOVES_PER_TIME) {
            gameHandler.post(pullUpRunnable)
        } }
}

```

Finally, make the entire system appropriate to run and pull up any position filters to create a dump file that will be transferred to any connected devices. Keep this code in the MainActivity() subfolder and execute the code.

```

private val pullUpRunnable: Runnable by lazy {
    Runnable {
        // 1
        if (scoreboard.life > 0) {
            grid.flatMap { it.toList() }
                .filter { it?.position == DOWN }
                .run { takeIf { size > 0 }?.getOrNull((0..size).random()) }
        }
    }
}

```

App Result

```

        ?.apply {
            pullUp()
            val pullDownDelay = (MIN_PULL_DOWN_DELAY_MS..MAX_PULL_DOWN_DELAY_MS).random()
            gameHandler.postDelayed({ pullDown() },

```
