

- `planeNode.eulerAngles.x = -.pi / 2`
- `planeNode.runAction(self.fadeAction)`
- `node.addChildNode(planeNode)`
- `let overlayNode = self.getNode(withImageName: imageName)`
- `overlayNode.opacity = 0`
- `overlayNode.position.y = 0.2`
- `overlayNode.runAction(self.fadeAndSpinAction)`
- `node.addChildNode(overlayNode)`

IMAGE MARKING FOR ARCORE

Image marking can be done in ARCore using the 'arcoreimg' tool that acts as a commandline to reference images and, in turn, creates a database file of images. It can be obtained from the ARCore SDK and is built into Unity and the Unreal Plugin.

- First, open up the SDK and check the quality of the image followed by using the arcoreimg eval-img code to get a quality score between 0 and 100 for each image.
