

Voice assistants become increasingly capable because of deep learning.

understand what you are saying - both enunciation and language - and respond accordingly. It even allows Alexa or Google to translate text when you visit a foreign-language website. Even basic 'Googl-ing' is fueled by multiple machine learning and deep learning systems where it understands the premise of what you are asking right through to personalising your search results according to various standalone features.

Besides these obvious and visible manifestations of deep learning, this system is beginning to find merit in almost every industry present in the modern world. Computer vision for automated, driverless cars is another

Driverless cars are possible due to deep learning.
