

3. Object detection neural networks have led to the birth of smart mobile trashcans that capture waste as they move around. Similar schemes have been used in mining and drilling.
4. Pathway building or variants of the ‘travelling salesman’ problem are used by transporters to find the best routes to deliver more items in shorter time periods.

This barely scratches the surface of where researchers and industries have reached in the modern world by using data-intensive neural networks. To learn more about the powerful world of neural networks, read on and tune in to the next chapters that cover in detail about the specifics about some of the most common algorithms and use cases. It’s never been a better time to be an advocate for data.
