

Double spiral problem in TensorFlow Playground

This now results in two separate conda tabs being open with the libraries and is a recommended step in every machine learning project. To activate the environment after closing type `activate [filename]-tf`

Next, use the `tf` command and activate TensorFlow by writing- `import tensorflow as tf`

You are now in the TensorFlow environment and can play around the system using the extensions and IDE.

To remove the dummy file after editing and executing it, delete the file from the Jupyter netbook where the filename should appear once it was created.

To finally close Jupyter, either do it directly from the notebook or using the Anaconda command prompt. Click on logout on the terminal window, and you will be redirected to the logout page.

Type in `ctrl+c` twice. The system will prompt a dialogue box the first time to confirm the shutdown and do so after the second one.

In case if the same file was saved and had to be accessed and opened after shutting down the system, the user must type:-

- `source activate [filename]-tf`

GETTING THE LATEST OPTIMISATIONS FOR CPU AND GPU

CPU Optimisation:-

Since we're getting the optimisations from Anaconda Cloud, open Anaconda prompt and use the following instructions for Windows or MacOS:

- `conda install tensorflow-mkl`

Or you can also use this:
