

- `conda install tensorflow-mkl -c defaults`

If you want to get the customisations from the Intel channel then follow one of these procedures to get Intel-optimized TensorFlow.

- `conda install tensorflow -c intel`

And if you wish to install the optimisations into an existing Python installation using PIP, then use the following commands for the respective Python Version.

Python 2.7

- `pip install https://storage.googleapis.com/intel-optimized-tensorflow/tensorflow-1.11.0-cp27-cp27mu-linux_x86_64.whl`

Python 3.4

- `pip install https://storage.googleapis.com/intel-optimized-tensorflow/tensorflow-1.11.0-cp34-cp34m-linux_x86_64.whl`

Python 3.5

- `pip install https://storage.googleapis.com/intel-optimized-tensorflow/tensorflow-1.11.0-cp35-cp35m-linux_x86_64.whl`

Python 3.6

- `pip install https://storage.googleapis.com/intel-optimized-tensorflow/tensorflow-1.11.0-cp36-cp36m-linux_x86_64.whl`

Always refer to the current documentation for up to date instructions for all the optimisations that are available.

GPU Optimization:-

To get the latest TensorFlow PIP package that's optimised for an NVIDIA GPU with CUDA cores, you can use the following commands:

- `pip install --upgrade tensorflow-gpu`

Please note the package name is tensorflow-gpu in the above command.

Like with the CPU-optimised packages with different versions of Python, there are different packages for the GPU optimised versions as well. Use the appropriate command for your Python version:
