

Python 2.7 GPU

- `pip install https://storage.googleapis.com/tensorflow/linux/gpu/tensorflow_gpu-1.12.0-cp27-none-linux_x86_64.whl`

Python 3.4 GPU

- `pip install https://storage.googleapis.com/tensorflow/linux/gpu/tensorflow_gpu-1.12.0-cp34-cp34m-linux_x86_64.whl`

Python 3.5 GPU

- `pip install https://storage.googleapis.com/tensorflow/linux/gpu/tensorflow_gpu-1.12.0-cp35-cp35m-linux_x86_64.whl`

Python 3.6 GPU

- `pip install https://storage.googleapis.com/tensorflow/linux/gpu/tensorflow_gpu-1.12.0-cp36-cp36m-linux_x86_64.whl`

These are all Linux packages, for Windows packages, only Python 3.5 and 3.6 are supported. Here are the commands to get the same:

Python 3.5 GPU

- `pip install https://storage.googleapis.com/tensorflow/windows/gpu/tensorflow_gpu-1.12.0-cp35-cp35m-win_amd64.whl`

Python 3.6 GPU

- `pip install https://storage.googleapis.com/tensorflow/windows/gpu/tensorflow_gpu-1.12.0-cp36-cp36m-win_amd64.whl`

MOVING ON TENSORFLOW LIBRARIES

Next, download the CPU and GPU extensions by typing in the following commands to the python terminal:-

- `pip install tensorflow`
- `# For GPU`
- `pip install tensorflow-gpu`

To download libraries, use the pip or conda commands to install them. Users can also explicitly download the libraries online from the click of a button, but this usually doesn't confirm whether the terminal system identifies them in the computer or not. Sending commands directly always confirms whether they're in the system or not.
