

Getting Started with AI

The constant buzz around artificial intelligence is hard to miss unless you have been living under a rock. Dynamic, volatile and ever-changing - these are words that aptly define AI and its many facets and applications. Artificial intelligence came into existence in the 1930s, when they were mostly called 'machines' and not AI. Since then, the world of AI has been growing by leaps and bounds with factions like machine learning and deep learning coming into existence. We attempt to get you started with AI by delving into the intricacies and nuances present in this labyrinthine world.

Gauging and truly understanding AI and its factions can often seem like a tedious task. However, the entire world is being swept up by the data revolution so it becomes handy to assimilate enough knowledge about scientific reasoning and statistical knowledge that lie behind the codes and numbers enumerated in AI. In the second chapter, we attempt to delve deeper into the world of deep learning which is often mistaken to be interchangeable with machine learning. We give you the lowdown on the differences between the two keywords, as well as AI, and the numerous applications of deep learning for both consumers and enterprises.

Neural networks is a buzzword that you will come across astoundingly often when you study AI, machine learning and deep learning. Since they
