

```

• for (i in range 10)
• {
•     x[i]=i*i;
•     print x;
•     plot(x,i);
• }

```

FOR A HASSLE FREE EXPERIENCE - INTEL® AI DEV CLOUD

With any project, there's always the hassle of reading up on the hardware just to see if it is compatible with all the software libraries that you've chosen. So a ready to use solution is always welcome and the Intel® AI DevCloud is one such solution. It's basically a cloud-hosted hardware and software platform that developers, researchers and startups can make use of to learn, sandbox and get started on their Artificial Intelligence projects. Moreover, if you are an Intel® Academy member then you can gain free access to the Intel® AI DevCloud.

KNOWN ISSUES AND THINGS TO NOTE

On Windows, TensorFlow only supports 64-bit Python 3.5.x while on Linux, Python 2.7 and above are supported.

While Google does not officially test TensorFlow on 32-bit architecture, you can compile a CPU only 32-bit version if you wish to.

Pip is a package management system that is used to install and manage software packages in python and can be used to import packages and models with simple commands. Python commands look simple and seem to be but can make beginners frustrated when downloading packages.

Newer versions of Python tend to misattribute the presence of the packages that have been downloaded even when explicitly searched for through the who command in the terminal. The key is to start all executions as an admin and avoid any confusions later on.

Certain package updates require a working internet connection and must be done with the jupyter notebooks being given access rights for downloading from the internet. Also, take note of the fact that Anaconda and Jupyter have certain differences regarding the commands for global extensions and packages which can be reviewed by simply checking the terminal manually.

Certain libraries and extensions like tm, glue, SnowballC and tidyverse can become obsolete even after being downloaded. This is why it's always recommended to see whether the system identifies them through the terminals. Again, execute these commands as an admin.
