

Project - Part 3

Read on as we discuss the execution and result reviews from the previous chapters for the object detection algorithm. This one is going to look deeper into how the system responds to the code and build upon some inferences.

After having worked on the coding for the object detection system, we now move on to the execution commands for TensorFlow through the Python terminal. Once the code for inputting, labelling and detecting are complete, it becomes important to specify to the system details about the files where the output will be formatted, where the results of the execution will be stored and how the results will be called back in the future.
