

```

lelism_threads=2, allow_soft_placement=True, device_
count = {'CPU': NUM_PARALLEL_EXEC_UNITS})
•
• session = tf.Session(config=config)
•
• os.environ["OMP_NUM_THREADS"] = "NUM_PARALLEL_EXEC_
UNITS"
•
• os.environ["KMP_BLOCKTIME"] = "30"
•
• os.environ["KMP_SETTINGS"] = "1"
•
• os.environ["KMP_AFFINITY"] = "granularity=fine,verbose,com
pact,1,0"

```

If you are using Keras with TensorFlow as the backend, then use this:-

```

• config = tf.ConfigProto(intra_op_parallelism_
threads=NUM_PARALLEL_EXEC_UNITS, inter_op_parallelism_
threads=2, allow_soft_placement=True, device_
count = {'CPU': NUM_PARALLEL_EXEC_UNITS })
•
• session = tf.Session(config=config)
•
• K.set_session(session)
•
• os.environ["OMP_NUM_THREADS"] = "NUM_PARALLEL_EXEC_
UNITS"
•
• os.environ["KMP_BLOCKTIME"] = "30"
•
• os.environ["KMP_SETTINGS"] = "1"
•
• os.environ["KMP_AFFINITY"] = "granularity=fine,verbose,com
pact,1,0"

```

Testing accuracies

```

• for eachObject in detections:
•     print(eachObject["name"] + " : " +

```
