

Apple Photos

Apple Photos is to the Apple ecosystem what Microsoft Photos is to Windows. The one stark difference between the two is that the automatic albums aren't as editable as Microsoft's. This program syncs with the online storage service iCloud. While the services provided by Apple Photos come at no cost attached to them, a maximum of 5GB storage is provided along with it. If you wish to expand your memory storage, you will have to be ready to shell out some extra money.

Apple Photos comes with the option of search based on detected object types. For instance, you type in 'tree' and it will automatically detect images with trees in them. Microsoft also boasts of this feature, but can unfortunately only work with photos that are stored online on OneDrive. One of the key differences that work in Apple Photos' favor is that it can also be integrated with the plugin –Perfectly Clear. This makes it a clear choice for power users who were unhappy when Apple discontinued the intermediate level Aperture Program.
