

disposal, the internal functions and plugins used to manipulate and modify the images are mostly the same.

Therefore the knowledge gained in one application can be easily transferred to another as the only difference lies in the layout of the program and the plugin themselves. We shall use the freely available GIMP application so all readers can follow through the image editing process described without having to pay for premium applications. However, Adobe provides a free trial plan for all its software that you can use to try any of their applications including widely popular Photoshop and its assistive applications.

Some Types of Photo Editing

An image can be deformed in numerous ways. Therefore numerous techniques of image processing are employed to get the intended effects. Depending on the environment, lightning conditions, lens type used or the experience of the photographer himself, the quality of the image can vary significantly. Therefore photo editing tools use efficient algorithms to remove any unwanted effects. Some of the commonly used types of editing used in photos are described below.

1. **Noise Reduction:** Noise Reduction is the reduction of the visibility of white dots in your image that begin to appear when the image is shot with digital zoom or zoomed into in post production.
2. **Lens Distortion:** Lens distortion is of two types– Barrel Distortion and Pincushion distortion. Barrel Distortion is the one in which the image bends outward. Pincushion distortion is the one in which the continuous lines turn inwards.
3. **Composition:** The composition of an image is defined as the art of editing an image to grab the attention of the viewer in a particular part of an image, which is supposed to be the subject.
4. **WB Adjustment (White balance adjustment):** It is merely defined as adjusting the colours in an image to make it look less whitewashed.
5. **Colour Adjustment:** Colour Adjustment is defined as controlling or making the necessary adjustments to control the balance of red, green and blue hues in the image.
6. **Tilting/rotating image:** Rotating an image means to turn that image to a certain angle. Tilting an image can be done to improve the stability of an image or to straighten up a wrongly inclined image.
7. **Cropping an image:** Cropping is defined as removing undesired parts from an image.
