Cropping

After downloading and installing GIMP, follow the below easy steps to crop an image. The same functions can also be implemented in Photoshop with the crop tool it provides.

- Select the area in the image window which you want to crop.
- Now, you have to select the Image option from the menu by clicking on the small left arrow in the image window.
- Now select Crop Image and the image will be cropped as per your defined dimensions.
- If you want to resize the image, click on the Rescale Image under the image menu.
- Now, you have to enter a new width for the image and after that, click on Scale. Now, the image will resize as per the width you have entered.

Tilt/Rotate

There can be many reasons to rotate/tilt your image. It's easier to tilt an image in Picasa and some commonly used mobile apps. If you're going to tilt or rotate the image in GIMP, follow these steps:

- Click on the "Rectangular Select" under the toolbox window.
- To make a selection; while holding the left click of your mouse, draw a small rectangle. This gives you a selected part of the image.
- Now, you have to click on the 'rotate' tool inside the toolbox window. This tool rotates the selection or path. Rotation dialog box will open, upon clicking the image or collection with this tool.
- Now, in the editing area, click on the selection you have made in the second step. A rotate window will now appear on your screen.
- Now, provide your desired value inside the 'angle.' The selection will rotate as per the supplied value.
- Another way to do the same task is to use the slider. Just use the slider for rotating the selection. The selection will start turning as the slider moves.
- Once you are satisfied with the rotated or tilted image, select the "Rotate" button to apply your changes.
