

Colour tone adjustment via curve

For making the colour adjustment, there is a very great tool called the 'Curves.' By using this tool, you can change the contrast, colour, etc. of the selection in an effortless way. Since it involves adjusting the Red, Green and Blue hues of the image, it is used with RGB images.

For making the color tone adjustment via curve, follow the below steps:

- To activate this tool, inside the image menu under 'colors', select the 'curves' tool.
- The active layer's histogram will display in the background with a linear histogram alignment line. It is also possible to change to the logarithmic in the upper right side.
- You can individually adjust the channels between RGB or the red, green, and blue to get the exact colour tone you want.
- The alpha channel can also serve as another choice and is useful while setting layers with transparency with GIMP.

This adjustment will bring you to the correct colour tone for your image.

White balance Adjustment

The human eye considers most of the light as white, but different intensities of light have slightly different colours. GIMP provides us with the ability to adjust the colours in an image automatically or manually. You can fix the white balance issue with Colours Automatic WB. This tool will change the histogram of a particular intensity, and easily consign the same length to all. Consider a situation in which the camera is capturing light, and the white balance is set incorrectly; the clicked picture will not have original cast. Go with the following steps to get the correct white balance.

- Select and open the photo you want to edit.
- Select levels under the Levels menu and a dialog box will open on your screen.
- Select and click on the Pick button.
- Using the grey point picker, click on the photo.
- Now describe the mid-grey tone.
- Your image will be automatically improved.
- If you're satisfied with the output, click the OK button.
- You can also adjust the colour balance under the color balance tab inside the colours check by clicking on the shadows button.
