

which you use the brightness and luminance adjustment rather than the exposure.

- **Contrast:** Increase or decline the distinction between the dull and bright territories.
- **Saturation:** Make the hues pretty much energetic. If you need to heighten the shades of your photograph, you have to increase the saturation of the photograph. Once more, don't soak the photograph excessively as it can look undesirable and be brutal on the eyes.
- **Ambience:** Adjust shading immersion and differentiation in the meantime.
- **Shadows:** Darken or help adjust the shadows (dim territories) in your picture.
- **Highlights:** Darken or help adjust the features (splendid territories) in your photograph.
- **Warmth:** Add a warm orange or cool blue shading cast to your picture. Depending on what lighting is used for your photographs, the photographs can be somewhat blue or yellow. So as to adjust the hues, you can increase or decrease the glow of your photograph.

Quick tuning options

White Balance

The White Balance tool gives you a chance to upgrade your photograph by applying distinctive shading tints. Utilize these tints to improve hues, correct undesirable shading casts, or change the mood and outlook of a photograph. In the Tools area of Snapseed, tap White Balance. Swipe up or down to open the White Balance tools, at that point select a setting from the menu.

- a. There are two White Balance instruments:
 - a.i. Temperature: Make the hues in your photograph cooler (progressively blue) or distinctively warmer (orange).
 - a.ii. Tint: Add a green or pink shading tint to your picture.
