

Developers can control the size, dimension and feather of the brush before making the final move. They can also run an A/B brush test and have two brushes present for the editing process. Designers can switch between brushes using the “slash (/)” key. While there are also presets present in the software, designers should experiment with a range of brushes before choosing the final one.

Designers can also choose a specific colour for their brush and use the tool to their advantage. They can leverage the eye-dropper and select a colour from the composition itself. Using the auto-mask tool is also helpful as it allows editing to be only done within a certain area. It's great for when you need to run brushes across a certain element within the image.

The adjustment brush has various sections including temperature, tint, exposure, contrast and highlights. These settings allow designers to experiment with the type of emotion they want to convey using the brush. While the emotion is important to showcase, the image itself can be well balanced using the brush tool.

Filters (radial, gradual, etc.)

Some tools allow you to make macro-level changes to the composition, while others (like filters) that make changes to only certain parts of the image. To create a gradual filter, you need to click on the Develop module and go to the grey rectangle on the right sidebar. From there you can access the controls for the graduated filter easily.

You can click and apply the filter across any particular area that is available. You can also click and drag the outside lines to ensure that you can feather around an image. The radial filter is another excellent tool available to all designers.

The radial filter is on the right of the gradual filter and has a circle-based icon. You can create and alter the radial filter exactly as you could with the gradual filter. Masking tools should help you cover the area that you need to apply the filter on.

Designers can add to or remove from the mask by clicking on the brush option. This is a great way to ensure that the selected area is being affected and the surrounding zones are left as is.

Designers can leverage their creativity to create a plethora of experiences using the tool. They can also create interesting compositions using the filter tool. For creative campaigns, they can turn the background a certain colour. For portfolio shoots, one can add a black and white filter to a selected item.
