Range masks

Range mask is a simple way for designers to control specific areas of edited images. They can design the image to have only a certain area receive the edit. The other areas can remain as is, and unaffected. This is a great way to introduce zone-specific edits that can be applied across various elements in the picture.

Designers can use two main methods of applying masks – luminance and colour.

From a luminance tool perspective, you can edit locally and change the shadows, highlights, and mid-tone luminance range. There is also a smoothing slider that allows you to change the intensity of the masking effect. One can go from hard to soft while editing the image.

The colour range mask allows you to mask on brightness and colour ranges. You can use the dropper tool and mask a certain area within range. You can either select multiple zones within an image or choose one single zone using the eyedropper tool.

You can also make macro edits to the image and then remove them from certain zones by using the range mask. This allows you to get multiple perspectives on a single image so that you can make the final call.

Using the histogram, you can also make selective edits on particular parts of the image in question. This can allow you to get a technical macro-
