

meetings to prepare different variations of the original concept. This helps in finalising the right approach sooner. While editing on mobile is a difficult skill to master, the mirroring of concepts is present.

Split Toning

Split Toning on mobile is a feature that has been introduced for a long time now. Designers can leverage apps that have colour wheels in-built so that they can choose the perfect tones. From complementary colour schemes to adding retro filters, there are various applications built for split toning.

Many of the most popular filters are derived from split toning. Designers can choose the right dark and light hues to add that pop element to the picture. They can also set out the right emotion being portrayed in the image and create the perfect warmth of coolness. Lightroom and Adobe Photoshop on mobile have these features built-in.

Understanding the histogram

Histogram graphs are one of the primary functions of many apps available for mobile editing. Snapseed, offered by Google, provides pro-level editing and histogram illustrations for quicker editing.

Designers can also review the image quality from a graphical perspective. They can then compare the image to PC editing histograms for a more accurate picture. Histograms can be viewed as per the image and are consistently displayed across all major mobile apps.
