

To the wizard in you

There's been a paradigm shift in how we record our memories. Ever since smartphones have become ubiquitous, especially in India, we've seen a massive uptick in the amount of photos and videos that's being generated. The whole perspective that Indians are a shy folk has been thoroughly turned on its head in the last two years. Install any of the popular social media apps which are image and video heavy and you'll see what we mean. It's not just folks in the tier-1 cities that are producing visual content – we might as well say that a good chunk of the contribution comes from the rest of the country. With each image that makes it to the internet, there are 10s or even 100s of images that don't make the cut. Some might have a massive finger photobombing while others might end up being a bit too dark for your liking. Some of these images are discarded for issues that can be easily fixed. Here is where this FastTrack comes into the 'picture'.

Editing images don't need a beefy computer with a 16-24 core CPU and a graphics card that costs more than two kidneys. The SoC powering your smartphone is capable enough to pull off filters and complex edits that would have been labelled magic a few hundred years back. So why not make use of that processing power and breathe new life into your images? Got a photo with way too many elements? Blur some of them out and bring your subject into focus. Or perhaps you'd like to apply a colour filter that renders just that colour visible and turns the rest of the image black and white. Or perhaps you could make an ordinary looking photo of your country-side native home appear like Bilbo Baggins' Hobbit-hole from the Shire, complete
