

It makes the job of mobile editing easier as there is no ambiguity in the editing process. Since mobile devices can have different screens and resolutions, it helps to have a singular point of reference in a histogram.

Raw image processing becomes that much easier when there is a histogram available on the mobile app. There is also a carry-forward effect when the image is viewed on the camera and then the mobile device. This helps in bringing uniformity across the board when editing.

Additionally, when taking raw images from the mobile camera, it helps to analyse the histogram for editing capabilities quickly. If the histogram doesn't show a positive picture, then the camera can be used to take an additional image. This quick picture taking and editing process speeds up the editing process as the raw image is of higher quality.

Designers can also compare multiple mobile images with one another to understand them from a technical point of view. The histogram gives them information about mid tones and how overexposed images can appear after editing. It's a great way to find out the quality of the photo as well. Adobe and other app developers have sophisticated apps to determine the photo quality.

Spot correction

The spot correction tool is one of the most important tools that can be used by mobile image editors. It is present in Adobe Express and is a quick tool that can remove blemishes, acne and unwanted spots. It can also remove elements from the background that aren't needed. Multiple apps have spot correction or retouching features available as a single feature.

However, it helps to leverage the full capabilities of professional tools offered by premier players including Adobe and professional apps.

Photoshop Express has specific looks and filters that add those effects as a preset. Designers can leverage these filters to spot correct any unwanted elements. For social media posting, using the perfect spot correction tool can help. This is an essential tool that many photographers and brand advisors use daily.

There are professional tools for correcting red eye, removing blemishes and auto-enhancing images. Designers can pull up images through the app and add various spot correction tools to the raw image. From there, they can add filters and enhance the overall quality of the composition.

Using cloning and healing, designers can correct for various blemishes, acne and unwanted marks on the portrait.

Mobile spot correction tools can help in enhancing the image in the following ways:
