

- Create quick changes in the image while preserving the quality of the composition.
- Remove red-eye or other common errors.
- Perform preliminary edits before taking the picture to the PC.
- Creating on-the-spot edits for memorable experiences.
- Using raw input (thumb, stylus, etc.) for faster spot correction.

Spot correction on portrait

Adjustment brushes

Lightroom CC and other mobile editing tools allow designers to use adjustment brushes from the app itself. This means that you can edit the image from the app directly and then apply more filtering and layering for future editing purposes.

The implementation of the adjustment brush is organic through mobile apps, and the overall composition looks stunning. While different images can be viewed on different apps, if mobile is the aim of the image then mobile editing is a good alternative.

All features including, auto masking, size, feathering and flow are similar to that on mobile and PC. That's why designers have complete freedom to create memorable experiences. Added to that, various brushes can be installed into the app, which can be used by the community.
