

helps in creating a faster image that can become a reference point for PC editing. Mobile has come a long way in the editing process and is showing its full potential in the filter arena.

The final images can also be quickly posted on social media platforms thereby reducing the time to publish.

Graduated filter on mobile

Range masks

Range masking on mobile is easier than ever. Although the process is simplified, when compared to PC, the mobile aspect is easier to execute. The tool works across the board, with multiple steps being implemented along the way.

Lightroom has an effective feature called range mask, which allows you to modify your filters and brushes. The area affected is limited, and you can use your finger to manoeuvre around the area. The screen is your canvas as you glide your way through the image. You can darken, desaturate the landscape or use a specific range mask for people rather than architecture.

The possibilities are endless with range masks, with designers using them regularly. It also allows you to get more precise with your work as mobile editing can get rushes sometimes. You can also get into the deeper nodes within your design aesthetic as you focus on specific instances.
