

Editors can change the colour and luminance on mobile devices, as the technology is accessible and easier to work with. Both modes work on PC and mobile devices. That's the beauty of using Lightroom and Adobe Express. They're developed for intermediate editing as well as basic editing.

Selecting the right area size is key as mobile screens can be smaller in size. That's why the depth of the editing process is limited to a certain area. The aesthetic can be maintained with the overall look being similar to that of PC. However, it's advisable to use range masks in a limited manner on mobile and leave the complex editing for PC software.

## Blending

The blend tool allows for quicker blending between images and different colours. With mobile editing, designers can add two images into one and effortlessly blend them into one another. The same goes for any two colours that may be being added to a single layer.

Designers have to use their fingers or stylus input devices to create the blend effectively. They can edge out the areas that aren't needed and start working on blending the necessary zones.

Today's mobile editing software is so advanced that it can automatically blend the saturation and the contrast to the master image. This makes

Blending on mobile
