Cloning

Cloning allows for creating richer images that have more depth in them. There are no limitations when using mobile editing software, as most of them have a cloning feature built into them.

Snapseed and Adobe both have an effective cloning feature wherein you can add elements to the master image. Designers can clone out or clone in features that they want to by using the tool. If there is a wedding shoot going on, and the designer wants to remove unwanted elements from the background, then they can do so by tapping on the clone tool.

The tool will search for an area that is used as a reference and then replace that with the selected spot. This gives a more seamless addition on mobile, all the while providing you with a richer image. The result is far more effective than having the image be raw or source-focused.

A nature image can become that much more effective when designers add a few more birds or petals in the background. The overall image has a more goal-driven outcome. Designers can also create experiences that are richer by adding more elements from outside the composition. One can add skyscrapers in the background of a corporate office to make it look more sophisticated.

Cloning can be readily accomplished by using the tools available inside mobile devices. If there are imperfections in the background, blemishes on the raw image or light effects that need to be removed, the clone stamp is the perfect tool to leverage. Designers can also make an image blend better with the background by cloning certain edges on the front. **d**
