

You can set the size, hardness and spacing of the brush so that you can be accurate enough on the spot correction. Opting for proximity match is a good way to start the process. You can focus on individual areas where you want to remove certain unwanted elements.

By clicking on the edges of the area, you can get a pretty good picture as a result. This is because the software automatically detects the blemishes and unwanted areas and replaces it with pixels nearby. Additionally, the aware content feature goes one step ahead and smoothen out the image for you as well.

This process gives you a complete way to conduct spot correction. You can also focus on larger areas and allow the tool to clear out unwanted redness on the neck. It's important to ensure that you're not changing the important bumps of the collar bone while doing so. Otherwise, the picture will not have that natural finish.

You can also start working on the T-zone around the eyes and nose. You can clear out the pores, the blemishes, acne, etc., using the tool. You can also use the clone stamp tool if you want to have a perfect finish. Sometimes the healing brush or spot healing brush tool may not get the perfect look.

When you're focusing on under the eyes, you can switch over to the clone stamp tool and remove the unwanted areas.

Adding the adjustment brushes and range masks

The next step is to focus on using the right adjustment brush and range mask. These tools help designers to focus on certain areas like lips, eyes and ears and give them individual touch-ups. It's important to do these things from a micro-perspective as the image comes out excellent if these steps are ensured.

You can start with the lips and have a unique adjustment brush for that part. You can change the colour tone to make them lighter, and start working on them individually. This is helpful as the eye is diverted to key attributes in the portrait.

The eyes can be made brighter as well, with richer colours and more depth. Another adjustment brush can help, here again, this time focusing on making the colour deeper and having the mid tones pop-out. Similar steps can be done for other body parts like hair, cheeks and the nose. You want to focus on individual body parts to bring out the final image.

Range masks can help you step up your game when it comes to editing existing sections within the image. You can also apply range masks when
