

you want to focus on local adjustments and certain body parts. As macro-level adjustments can change the formatting on other parts, you need to focus on local level editing. Range masks help you do so.

You can focus on the eyes to bring out the rouge and the natural colour of her iris. You can also focus the range mask to reduce creases around her smile. There are various applications of the traditional range mask that needs to be used to finish the final look.

Radial filters & blending

Using the radial filter can help enhance the overall look of the image. You can highlight certain areas within the image by using the right depth of the radial filter. You can then start to work on key areas and highlight them as needed. You can even increase the saturation, like around the under eyes and nose bridge areas.

Another radial filter can be applied by focusing it on the shoulders. The radial filter here can allow for greater editing and processing within that area. Since the depth of the shoulders needs to be subdued, it's important to have a unique one for that part. When it comes to the upper lip and chin, you can increase the hues to bring out the inner colours.

Blending is also going to play a vital role in the process. When you need to blend disconnected areas into one coherent image, you need to have the right tools at hand. The blend tool will help enable you to connect different colours, saturation and pixels in different body parts. This will help bring you the final image which looks more connected and well preserved.

When it comes to blending, you need to take your time doing it. The process is complex and requires hours of editing. That's why you need to slowly go across various parts of the face to ensure that there is continuity within the final composition.

Blending will also help you connect the background to the foreground better. After you're done editing, you can gradually allow the pixels of the portrait to blend better with the background. You can do it as a whole or individually in smaller parts to finish the final look better. **d**
