

with all the vibrant HDR filters courtesy of the wizards at Google, Adobe and Qualcomm, among others.

We understand that most of you will have smartphones with 'AI' features that do modify your images a little but then such features are sold at a premium. With the tricks that are present in this issue, you don't need those fancy AI features which aren't really AI to begin with. The chapters in this FastTrack are broken down into three sub-sections based on the complexity of the editing methods with the simple ones at the beginning followed by the intermediate ones and ending with some near-professional level-stuff. And we even have a small tutorial at the end of each section to help you apply those methods and try everything out yourself. Because there are a lot of new terms, we have a brief chapter demystifying those terminologies for you. Should your smartphone not live up to the challenge, then we've shown how you can perform the same edits on your PC as well. Hopefully, we've left no stone unturned and by the end of this FastTrack, you'll be able to record your memories in a way that's not just visual but has the emotional connect as well.

Do let us know if this FastTrack lived up to your expectations and as always, we're open to feedback. All you need to do is drop an email to editor@digit.in
