

a sports-based design house, then concepts like motion blur will be critical to your everyday job. It will also help to build up your portfolio in these domains so that you can get a better outcome for your work.

When it comes to having complex design processes, the finish is as important as the overall process. That's because the finish of the image is what makes it worthwhile. Otherwise, designers may miss out on minor details that add to the overall piece.

Adding motion

Software like Adobe Photoshop and Lightroom have specialised features to enable better capturing of motion and adding blur to appropriate areas. A generic blurring approach will not work here, as you need to focus on smaller elements within the image itself. This can also be done effectively

Adding motion blur to an action image

if you focus on the greater picture and the emotion you're trying to invoke. In the case of the sports bike, you're showcasing action, and an adrenaline fuelled experience.

You can start by converting the image into a smart object in Photoshop. This is done by right-clicking near the image and choosing the smart object option in the menu. You can go to the already existing blur options in the software by going to Filter. From there you can go to the Blur Gallery and Field Blur. You can click and drag to select the level of blur that you need
