

from that image. You can then also create a blur around one direction or one area and showcase motion. This is also effectively done by adjusting the angle to match the direction of the object. This has an overall impact on the action happening in the image. The distance setting can also help you control the amount of blur that you need.

In the end, it's important to have a unique perspective when using motion blur. This is so that you can adequately adjust the amount and depth of the blur. Additionally, you can also change the emotion behind an image by adding multiple layers of blur within a single frame. This adds an extra sense of excitement and energy to the image.

It's also important to isolate the blur effect. You can mask the areas where you want to restore the blur and where you want to keep the details. In the layers panel, you can use the smart filter mask and brush tool to paint over key areas. This can be done in smaller areas as well. It also allows us to keep the subject in focus while the surrounding is blurred effectively.

You can also create a blur along a specific path on the image. This can be done by using the path blur functionality and executed along a curved line.

## Reflection

Reflection is another important complex tool that can be accomplished using PC editing software. It's an essential component of mastering the art of editing as there are many times where adding a simple reflection makes all the difference. Whether that be to make a smoother transition or creating depth in an image, reflection is key.

A reflection is also an essential tool when there is a dichotomy in an image. It helps to combine different element that may seem disparate at first. Adding a reflection can make a scene look more realistic and adds another layer of depth to the photo. The final edit looks that much more refined and well edited.

Reflection can be accomplished by using a variety of tools in the software. Essentially, you will have to copy the portion that you want to invert, invert it and then paste it below the connecting line. Then you need to blend it all to create the perfect super-position of the original. This is a time-consuming process if a designer hasn't mastered the effect yet.

You can start by selecting the right amount of data to copy over and then create a new layer around that. You can select the exact portion of the building or the landscape or a subject. You can then copy it on to another area (preferably below). Alternatively, you can also copy the layer on another
