

Additional light source

Why is adding a light source an important tool to master? Because there are cases where the lighting may be poor or adding a light source adds an element of uplifting to the image. Using the histogram, you can review the overall lighting and tones being used in an image. This will help to give you a thorough idea about what is the exiting lighting condition.

You can try to increase the exposure of the image, but that might not get the job done if the image is darker or shot at night. This is precisely when adding a light source helps immensely. If you want to create new elements like sunshine or street lighting, you can do so directly on the software.

Sometimes capturing the natural light or artificial light is difficult on camera. The entire image gets, and the hues get shifted towards that spectrum. That's why many design houses prefer that the lighting is added in post. In other words, the lighting effects can be added to the software instead of being introduced in the frame.

Adding a Lightsource onto the frame

This is true for any picture, from natural landscapes to localised film shoots. Having artificial lighting available is one of the key skills that all designers must understand. They can completely change the look of the image by adding a light source in the image. The light source can act as a brighter or mood-lighting element depending on the final objective of the shoot. If need be, the model in an image could hold a light around their
