

person to demonstrate qualities around them. You can also bring the eye closer to an area when you attract subtle lighting towards them.

This is a commonly used process to bring attention to a certain part of the shoot. You can also do so for a product shoot or a natural shot as well. You can start by duplicating the main layer and adding a rendered lighting effect.

You can find this on the filter section in Photoshop. From there you can select certain areas where you want to add the lighting effect. You can also select graduated filters or radial filters around certain areas. This is effective in the case where you want to limit the light source around a certain area or restrict its effects on key focal points.

Designers can also use lens flares, which can be found under the light effects tab. These lens flares can add a sense of sunlight reflecting on the camera. It can create a dynamic effect in the image and a stronger mark in the overall photo. You can focus a lens flare on a product to make it look authentic and unique. A garish lens flare is a widely recognised indication of poor photo editing skills, so use with caution.

You can also use blur effects in conjunction with lighting effects to create a more dynamic image. You can accomplish the task by creating multiple layers within the software and programming them in such a way that they blend. You can also create multiple layers with different lighting strengths to review the shadows and the interplay of different tones. This is helpful when tying everything up to finish the final image.

Shadows

Shadows allow designers to bring in depth into a picture. It can add a sense of realism to the image and creates a more dynamic photo as a result. Shadows can be added to products, people and landscape elements. They are also used extensively across other applications of image capture.

Shadows can showcase an emotion, a light source and a feeling. Shadows also signify movement in a certain direction and the time of day. These elements can be interplayed to create unique moments captured in the image. Designers must be able to recreate shadows and understand how they work within the lighting domain.

Shadows are also important to understand when you have multiple objects in a single line of the light source. As a shadow can be cast on an object, it's important to remove them from distinct images. This can also be done by using shadow-removal techniques like cloning and healing. You
