

looks realistic. This can be done using the opacity and blur effects tab within Photoshop. Once you've got your blur, you can add the shadow based on where the LS is. After you're done with the placement of the shadow, you must blend it into the original picture. This can be done using the blend tool available in Photoshop, and start blending the natural elements around the shadow cast. Since there can be multiple elements in the image, it's important to blend around them as well.

Vintage Restoration

The vintage restoration procedure is essentially helpful in the case of modeling, film production and historical recreation. It can also be used to bring back old memories for families that have physical photographs. This can help bring them closer to the departed.

From an editing standpoint, vintage restoration uses basic principles that can be applied elsewhere as well, giving it value outside of vintage restoration as well.

You need to start with fixing the torn or folded areas within the image. You can do so by using the heal or cloning tool to find the right reference point in the image. After this, you can create a more layered out image that is neatly presented. This gets rid of a majority of the vintage feeling that many older photos have.

The next step is to crop out the areas where the image may have been ripped and to add in colour or a frame around it. This can give it a more natural look and a more fully restored experience to the image. While the final image may not be true, it's true enough for the final product.

You can then move on to individual parts within the image where there are noticeable rips or folds. You can use adjustment brushes and masking to ensure that those areas are being treated per the requirement. Additionally, you can also blend in the background to the subject so that the overall image blends better than with the vintage.

Vintage restoration also requires you to select the perfect colour shade to represent the image. You can opt for bluer hues as they represent the older past while bringing that Black and White texture to them. It's a complete look if you opt for a lighter shade as well. This brings out the features of the image, and the vintage restoration process is more complete.

As the face is the most important part of the image, you can focus on it first. Since there isn't much of an area to focus on, you can zoom into the face and work on the features. The goal is to have the face be as clear as possible
