

Reflection on mobile

The next step is to blend the reflection with the recipient element. If you're doing a reflection in the water, then the temperature of the water will decide the reflection length. The emotion you're trying to convey will change things as well. Additionally, the tone of the water will be needed to be blended with the reflection. Various elements go into making a perfect reflection.

While the finger may be a perfectly viable input device, it's good to work with a stylus or pencil. This is so that you can use a wider range in brushes and create a more finished reflection. The reflection can be made stronger in certain areas and weaker in others. This helps in maintaining a more natural dynamic reflection in the image. To fine-tune things and wrap it all up, you need to blend the reflection at the pixel level.

Additional light source

When it comes to complex editing on mobile devices, it's important to understand the interplay between natural light and additional light sources. You can even add a natural light like feeling to the image that you click. This can be done to make the image more dynamic and brighter organically.

It also helps in situations where simply enhancing the exposure may not work. It's good to know that there are tools available to the designer who can then edit the image as per their requirements. There are various methods of adding a light source and multiple online apps that help accomplish the objective.
