

You need to start with a perspective and a goal before entering the editing realm. This includes understanding the framing and the picture's emotion. It could also be that you're working with a product portfolio shoot or having to work in low-light situations. This is when you need to add a light source that is effective enough to leverage in the long run. That's why you need to have a good understanding of how best a light source can enhance the image from the inside out.

It's not advisable to add a light source at any angle or point. That may shift the depth of field of the experience. It's best to focus on the image holistically and understand where the image needs the light to come from.

Luckily, Adobe has a myriad of lighting effects available to all designers that use the app. Multiple lighting sources can be added to the image, which brings out the energy in the picture. There are also lighting effects that can be used to replicate certain camera effects.

The right additional light source can help bring out the natural vibrancy of the image. There are multiple pre-sets that designers can choose from, each bringing a new sense of energy into the frame. Here are a few examples that designers can implement.

Natural light source while editing

2 o'clock Spotlight – This is essentially a yellow spotlight of medium intensity and wide focus. It's great for bringing life into outdoor shoots or movement-based photographs. Designers can leverage this look to bring in a natural light source where there isn't one present.

Blue Omni – This is a blue overhead omnidirectional light that has high intensity and no focus. You can use this in a variety of applications that require brightly lit indoor areas.

Light Circle – This is a classic 4-spotlight setup that has white light with a concentrated focus. It also has a yellow light with strong intensity, red with medium and blue with full intensity. The focus of the lights changes as well, and it adds brightness to the entire spectrum of colours in the frame.
