

MAXIFS & MINIFS

The new function returns the highest or lowest number in the range that meets multiple criteria. It offers greater flexibility to the user.

SWITCH

The function helps you evaluate an expression against a list of values in order. It then returns the first matching result.

Enhanced Map Chart

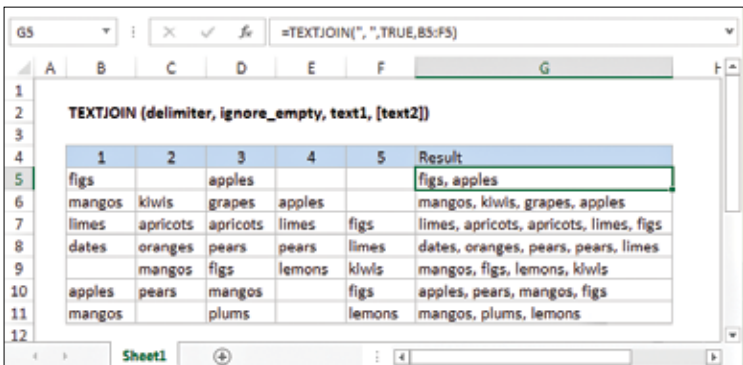

Geographical data can be better represented directly within the Excel interface. You don't need to switch software tools to create a map representing the pertinent information. This can be used with country-level data or city-level as needed.

Funnel Charts

This is perfect to demonstrate a sales funnel or an acquisition chart when it comes to specific points. The data set is generally decreasing over a length, which makes it visually similar to a funnel. The funnel chart can be used across a variety of industries.

TEXTJOIN

This function combines text from multiple ranges, and each item is separated by a delimiter that you specify. If the specified delimiter is an empty string then this function will work as the concatenate function.

TEXTJOIN (delimiter, ignore_empty, text1, [text2])

	1	2	3	4	5	Result
5	figs		apples			figs, apples
6	mangos	kiwis	grapes	apples		mangos, kiwis, grapes, apples
7	limes	apricots	apricots	limes	figs	limes, apricots, apricots, limes, figs
8	dates	oranges	pears	pears	limes	dates, oranges, pears, pears, limes
9		mangos	figs	lemons	kiwis	mangos, figs, lemons, kiwis
10	apples	pears	mangos		figs	apples, pears, mangos, figs
11	mangos		plums		lemons	mangos, plums, lemons

How TEXTJOIN works
