

You can also have automatic time grouping included within the new Pivot table format. There are critical UX improvements as well, especially in the domain of creating your first Pivot table. Sharing the data has also become that much simpler with these added tools.

By leveraging the complete suite of pivot tools available, you can talk about a subject area from multiple perspectives. You can also define the parameters better and explore various angles within the data set. Pivot tables can now aid in providing increased insight within the data set.

Visual changes and updates

There are significant changes to how users can work with SVGs and 3D modelling. Visual enhancements can be done within the Excel framework. You can essentially formulate the basic representation of your final presentation using visual aids.

You can add a visual element by creating charts and graphs that are represented as SVG options. This means that the visual element is preserved, and you can transform the graphic as needed.

There is also the element of 3D shapes that are available to all Excel users. You can define a 3D shape and add data to represent a complete picture. Using the handy tool, you can also rotate the image 360 degrees.

You get access to over 500+ icons under the SVG offering, and there are custom visuals present as well. There are also options available to create better funnels and maps. You can create more impactful presentations when you have access to a large resource of images and visual aids.
