

& - Concatenation

= < > - Comparison

It's best to use brackets to ensure that the integrity of the formula is maintained. Otherwise, there could be problems with using the tool's extensive reach. Errors in formulae or a possible mix-up in the order of operations generate incorrect results which affect the integrity of the entire data system.

A reference formula can be written as “=(A9+15)/SUM(E5: C5)” which can hold in place all the information necessary. Since there is bracket being used to contain certain elements, the formula can also make sense from a macro-level. **d**
