

- **Inside** – Inside borders are only active on the inside of the cell. This works best when working with different information blocks within one sheet.
- **Custom** – Excel 2019 allows you to design a custom border under the formatting options available. You can set different borders for different data types to demonstrate clearer differentiation.

You can also have borders that are chopped, lined or dotted, as you wish. This is great when differentiating between different data sets, and it allows you to experiment with the best option for your project.

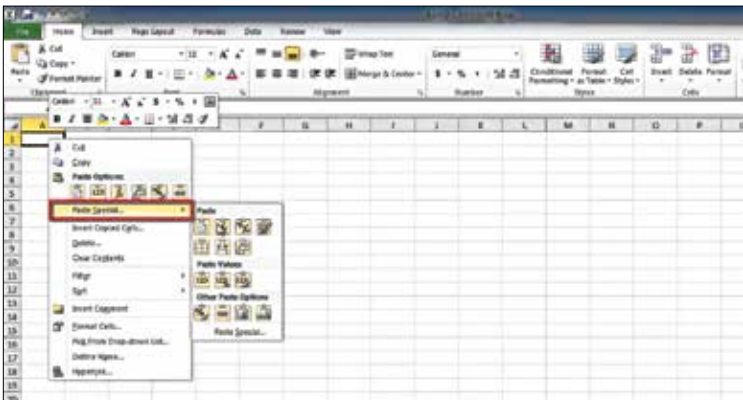

What are freezing panes?

If you want to block certain rows or columns, then you need to use freeze panes. This is a great way to get through a large number of data points quite quickly. All you need to do is to decide the row or column that you want to freeze and then go to the View option above. From there, you can click on Freeze row or Freeze Pane to secure your specific cell or row. You can also align your freeze panes so that they match up with your overall sheet.

When you've frozen a certain panel or row, you can unfreeze it anytime. You can then express your data points more robustly, by having the right labels or references available. Additionally, you can have your panes displayed dynamically by having them fixed upon a certain point in the sheet.

Linking sheets in Excel

You can link one sheet with another and have its data be represented directly in the workbook. You can also reference a sheet located in another server to

Linking between sheets
