

Sorting and Filtering

Both tools are handy when dealing with a single row or column that you want to analyse. You can also design your workbook to represent the data in the best way possible. You can set up custom filtering UIs that can be clicked and activated accordingly. It is a premier way to ensure that there is no information present in the data that is not required in that particular format. It's a great tool to use to create templates and standardisation across the board.

Sorting and Filtering can both be done using an extensive set of tools offered by Excel. Users can select the working area and then click on A-Z or Sort option.

You can customise your sorting and filtering by using the right options in the dashboard itself. This helps as you may have to face complex challenges in the domain that you're working in. Different industries have their requirements in filtering.
