

You can even assign certain monetary values to product categories, which the analyst can extract from after entering the final details. They can even have an HLOOKUP used for calculating the final price after offering a deal.

Forecasting is also made easier when you use HLOOKUP. You can assign values to future trends and use the Lookup table to determine the next steps. You can also create HLOOKUP functionalities that rely upon data entered through the domain. HLOOKUP is an extensive tool that can be used in conjunction with a host of new features.

HLOOKUP is used extensively in data analytics, healthcare and insurance industries. The syntax is as follows–

=HLOOKUP (value, table, row_index, [range_lookup])

It also supports partial match of an exact lookup, so that you can choose the version of the HLOOKUP that you need. Both answers can remain relevant as you sift through thousands of data points.

Using VLOOKUP in Excel

VLOOKUP is similar to HLOOKUP but works vertically. In other words, the column is scanned through and presented in the final output. You can use VLOOKUP in Excel when you're trying to find correlating data in a vertical line. Similar to HLOOKUP, you need to supply four critical lines of information into the formula –

- A. The lookup value that you're going to be scouting for. (category, name, geography, etc.)
- B. Range of cells or table array that needs to be scanned through. (Database, cell phone contacts, etc.)
- C. The column number from which data can be retrieved is another important aspect to consider.
- D. Finally, the matching mode (exact or false) is also important. If you want the approximate value to be considered, then you can do so via the matching type.

VLOOKUPs are critical for two main reasons.

Firstly, they can be used for uncovering hidden insights within heavier data sets. You can pull values from other data or sheets and compare with an existing correlating value. When you can match two data sets for common themes, you can create better insights. You can also drive greater value for the organisation.

Secondly, you can add or subtract the totals from each other while performing the processes. You can introduce new formulas based on the
