

An example of using VLOOKUP

lookup values provided in the array. While the array itself can be left unaltered, the close values can be altered and added to. This helps in creating a second-tiered impact upon base values.

What’s INDEX in Excel?

Many analysts agree that INDEX matches are better than Lookups as they provide more clarity and insight when dealing with larger scale. The core functionality of the INDEX allows for greater flexibility and more accessibility to the data itself. INDEX comes in when your LOOKUP problem is too complex to decipher.

If you’re not getting the results that you need with LOOKUP, you’re better off using INDEX in this case. It’s a standard function present in all Excel 2019 editions and can be used with a variety of data types and file formats. INDEX can also act as an independent GPS that can be used across the board.

You can also have multiple cells or rows present, and INDEX can find the right matching input. It can give you the value in a list or table based on the location. Its syntax is listed below –
