

Magicae Numero

If we were to make a list of software that we take for granted then Microsoft Excel will probably be high on that list. After all, we're introduced to Excel early in school and the most we tend to do is fiddle around with the basic formulae, an act that makes us question the purpose of using Excel in the first place since we can do the same on paper with relative ease. It's when you go beyond the simple functionalities do you realise the true potential of the humble spreadsheet. Everything from keeping tabs on personal expenses on a monthly basis to charting out an elaborate set of data to make sense of it all, spreadsheets are a lifesaver.

When it comes to spreadsheets, practically every solution in the market has, more or less, the same set of features. Some solutions may have a few formulae that are unique to it while some might have a slightly different syntax for passing arguments to functions and sometimes the difference lies in the amount of data you can work with on a single file. What makes Excel stand out is that Microsoft is going out of its way to make it available to every user. In the coming weeks, the current "My Office" app will be replaced with a new Office app and it will come preinstalled with Windows 10. Moreover, you will not require an Office 365 subscription to use it. Essentially, Microsoft is making the free Office online variant available offline as well. Since everyone is getting Excel, Word and Powerpoint for free, we might as well help you get a better understanding of the all powerful Excel.

With that in mind, we present to you, the FastTrack to Excel 2019. We start off with everything that's new in Excel 2019 before taking you back to your school days with a revision of the basic formulae as well as referencing
