

Wildcards

Wildcards can be used within these functions to represent one or more of any possible character. It can also be used to create approximations and partial matches when necessary. You can also define the wildcard when needed within the string.

Using SEARCH in Excel

You can search for specific terms within an excel sheet or even find a local version of the keyword that you're looking for. Analysts use SEARCH tools to ensure that they've covered certain parameters in their approach. Healthcare specialists can look up relatives of patients quickly by searching for the last name. You can also design a system that allows you to find local resources necessary for the completion of a project. The reference syntax is shared below.

=SEARCH(find_text, within_text, start_num (optional))

You need to highlight specific text to find that single keyword or letter that you're seeking. The function will show you the position of the character in the text directly. You can even have it start from a default number. You can skim your search further by allowing other parameters to come into play.

The OUTPUT value should show you precisely where the information is located. It can also demonstrate exactly where the keyword can be found. These could be keywords for SEO research, customer survey analysis or training your ML algorithm better.

Using LEN effectively

LEN is the length of the string of characters in a particular region. It's a quick way to show you the exact dimensions of the text entered. It's also considered as high-quality metadata to ensure that no text falls outside the parameters listed. The syntax is–

=LEN (text)

You can get started with this advanced feature especially in the domain of QC and logistics. In these domains, it's important to have the right quality checks, marks and data points captured. This is especially true when you have millions of data points present in hundreds of books.

You can, therefore, check for the length of the information, and you can find triple digits or large cells with added comments. You can then find these outliers and fix them immediately. This helps in maintaining a highly regulated worksheet as well.
