

first letter or the abbreviated version of the text onto the next stage. You can then concatenate from there and create more complex cells that have more information. This can also be set up to be a completely automated procedure.

The RIGHT tool serves a similar purpose but this time from the right-hand side. This tool is handy when trying to understand the last piece of information within complex data sets. You may get mixed data that has multiple informational elements included. You can, therefore, sort out and split the data using LEFT and RIGHT tools. This can help give you a clearer picture overall. MID is a great tool to uncover the middle value within a string of text.

The real results emerge when you can become proficient in the domain. That's when you can find true value as an advanced user.
