

How can we use charts better?

There are a wide variety of charts available in the Excel domain right now, and choosing the right one is an important part of showcasing information. Different types of data are suited to different kinds of charts. You can also think outside the box and experiment with unique 3D charts. It is important to have a holistic approach when it comes to chart data, but analysts need to understand the importance of the chart itself from a strategic level.

How to insert the right chart

While you may have a robust database ready, you need to understand how best to incorporate charts into your sheet.

1. Start by selecting the cells that you want to chart out. This is important as you want to have the data displayed correctly across the board. You can have the information listed as clearly as possible while conveying the right information within the table. By having the right planning strategy, you can give your charts more meaning.
2. You can then click on the INSERT tab and find the option for Charts. You can click on the Charts option and select any preferred visual representation. This is the best way to approach charting data as you can get a handle over complex systems.
3. You can then find the option for selecting a sub-option for your chart (say column chart and 2D column)
4. The chart will automatically appear on the spreadsheet. This will give
