

you a quick visual representation of the database. You can then design your chart from there and choose what colours and themes you want.

You can also change the data sets within the chart and watch the chart update itself automatically. This is also beneficial when it comes to charting different datasets that are connected to external sheets (online and offline)

What are the common types of charts?

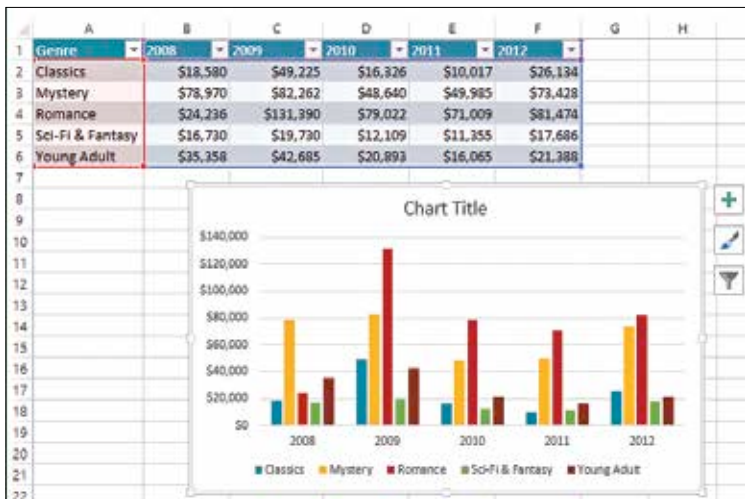

Excel has many chart options to select from, and selecting the right type of chart is critical. To take advantage of the charts available, you can design more robust systems within the database to leverage the capabilities of the data. There are many types of charts to sort through and find the ideal fit for the data.

Column Chart

A column chart is one of the most common types of charts in the Excel spreadsheet workflow. It can be used extensively as the primary chart solution for the data set you're working with. A line can be drawn to represent the meaning, and you can perform further iterations as they come through.

Line Chart

You can design the line chart in any way that you want (checked, stacked,
