

After you've selected your data set, you should move to the ribbon on top. From here, you can click on recommended pivot tables to get started. This should give you a basic PT if you have all the right categories and labels prepared. You will be presented with multiple layers and options at the start.

After you make your final selection, you can then modify it depending on your final goals. If you want to create new insights from existing data, then you need to have a more focused approach towards that data set.

Modifying and creating a Pivot Table

You can also create and develop your own customised PT so that you can have a more hands-on approach. Your new PT is available on a new sheet within your web book. You can then click on the sheet to then change the categories or source inputs within the dataset. You can also format specific cells to show data in different colours and designs. It's a visual and functional way to change the appearance of the information presented.

There is a list of fields that you can edit on the right-hand side. This menu is called the Pivot Table field. Through this, you can make changes as you wish. You can add new categories or reduce the load on the sheet. You can also add a raw category within the PT, and the changes should reflect in the main file.

One of the main reasons behind modifying a pivot table is the idea that the table is irrelevant. You can then create more relevant data sets and pivot tables that showcase real scenarios and project for better outcomes.

Creating a chart from a Pivot Table

Pivot Tables are more effective when data is represented in a visual format. This is done by making the right choices in the tables format or the chart to be prepared for the PT. You can start by clicking on the PivotChart option on the ribbon. This should take you to the next dialogue box that contains all the necessary information. You can click on Insert > PivotChart and then OK.

Additionally, you can have your data set be automatically charted by using the PivotChart option from PivotTable Tools. You can then go to PivotChart and then add/remove categories that are relevant. Pivot Charts do give you the freedom and flexibility to experiment within parameters.

You can also edit the table completely, as desired, and enhance upon the chart in any way that you wish. From formatting changes to editing the labels in the chart, there are many ways to interact with the PivotChart once it has been developed.
