

Creating charts from pivot tables

While no single chart is superior for any single Pivot Table, you can start leveraging best practices in the domain to get a clearer outlook. You can also design your charts to capture greater information across the table.

Using the slicer tool

The slicer tool is an effective element within the greater offerings of the Excel framework. While Pivot Tables are one of the most important skills to master, having a clear understanding of slicer tools is essential as well.

You can also use the slicer tool to gain more focused insights. You can also prepare data for the slicer in the same way that you would when forming a new PT. You can click on Pivot Tables on the menu above and then select the right option for creating a new table. After this, you can populate the table with the appropriate categories.

You can streamline your work using the slicer tool. You can go to the Analyse tab and then visit “Insert Slicer”. The slicer can then pop-up giving you more tools.

Once the slicer has opened, you can select from any of the categories present. The tool will give you a visual representation of all the sub-headings within the list. You can then apply the combinations directly from the slicer tool without having to go back and forth within the data.

The slicer tool is also dynamic, which means that the tool can update the sheet instantaneously. The effect is a more robust framework that depends upon inputs coming in directly from the user. This essentially makes your
